HALY seasonal campaign fulfilment
Business case study

Yusuf Ondes

Fictional company. Synthetic business data.

The campaign stock gap

HALY makes powdered drinks using inputs from two suppliers.

900
units ordered

500
finished units in stock

400
units to manufacture

The challenge: limited stock, competing dispatch dates.

HALY produces the shortage in-house.

Order fulfilment, step by step

Teams record physical work. Campaign rules control stock and shipment decisions.

01 **Order and dispatch promise**

Sales records the accepted warehouse dispatch date.

02 **Stock allocation**

Orders with earlier accepted dates receive available stock first.

03 **Purchasing and production**

HALY buys raw materials and manufactures the shortage.

04 **Shipment**

Individual orders ship in full. Corporate orders can ship in batches.

05 **Exception follow-up**

A linked risk item records the owner and next action.

Dispatch dates set stock priority

Initial allocation of 500 finished units across three orders.

Order	Shipment policy	Ordered	Dispatch date	Allocated
A	Individual: complete	200	15 Dec 2026	200
B	Corporate: batches	600	16 Dec 2026	300
C	Individual: complete	100	17 Dec 2026	0
Total		900		500

The accepted dispatch date sets priority for both customer types.

A new date needs customer acceptance

Order B: 16 December originally, 14 December after recorded acceptance.

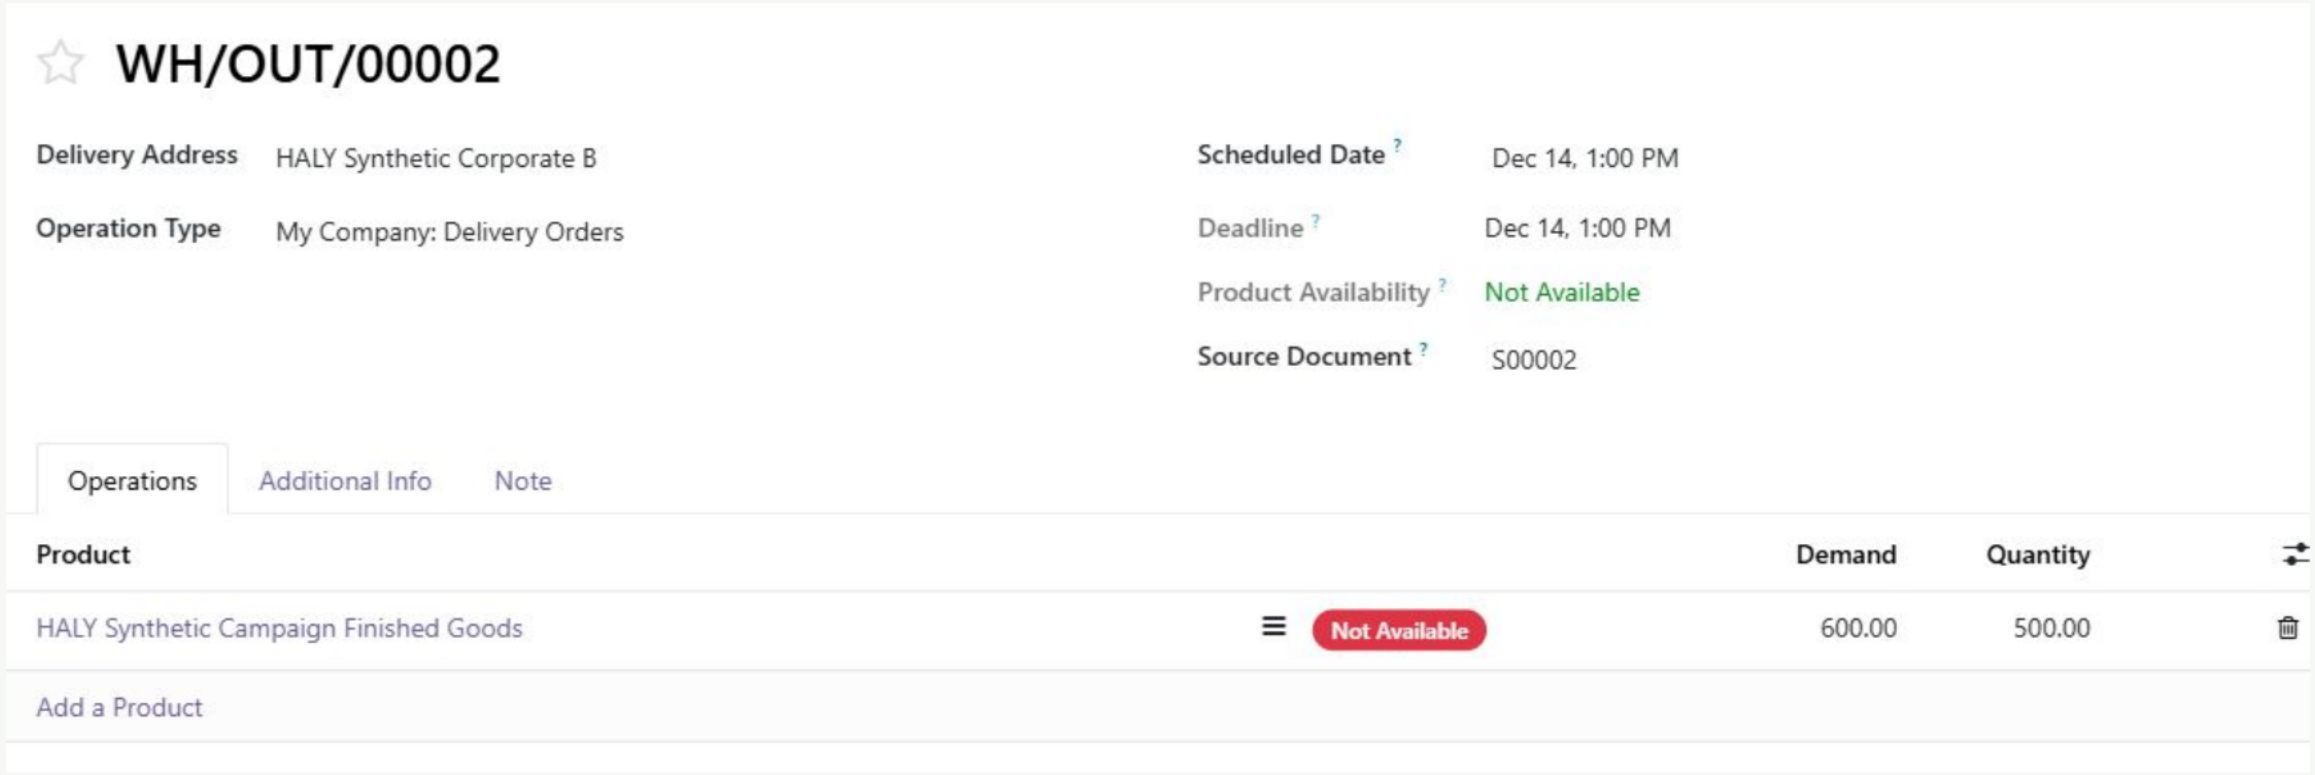

Order	S00002
Original Date	Dec 16
Current Date	Dec 14
Estimate Date	
Responsible	HALY Synthetic Campaign Coordinator
Revision	2
Established By	HALY Synthetic Campaign Coordinator
Established At	Oct 15, 2:02 PM

Proposed D...	State	Is Stale	Response Decision	Response At	Response User
Dec 14	Accepted	☐	Accepted	Oct 15, 2:07 PM	HALY Synthetic Campaign Coordinator

Acceptance of a valid proposal updates the date.
Pending or rejected proposals keep the current date.

Stock follows the updated date

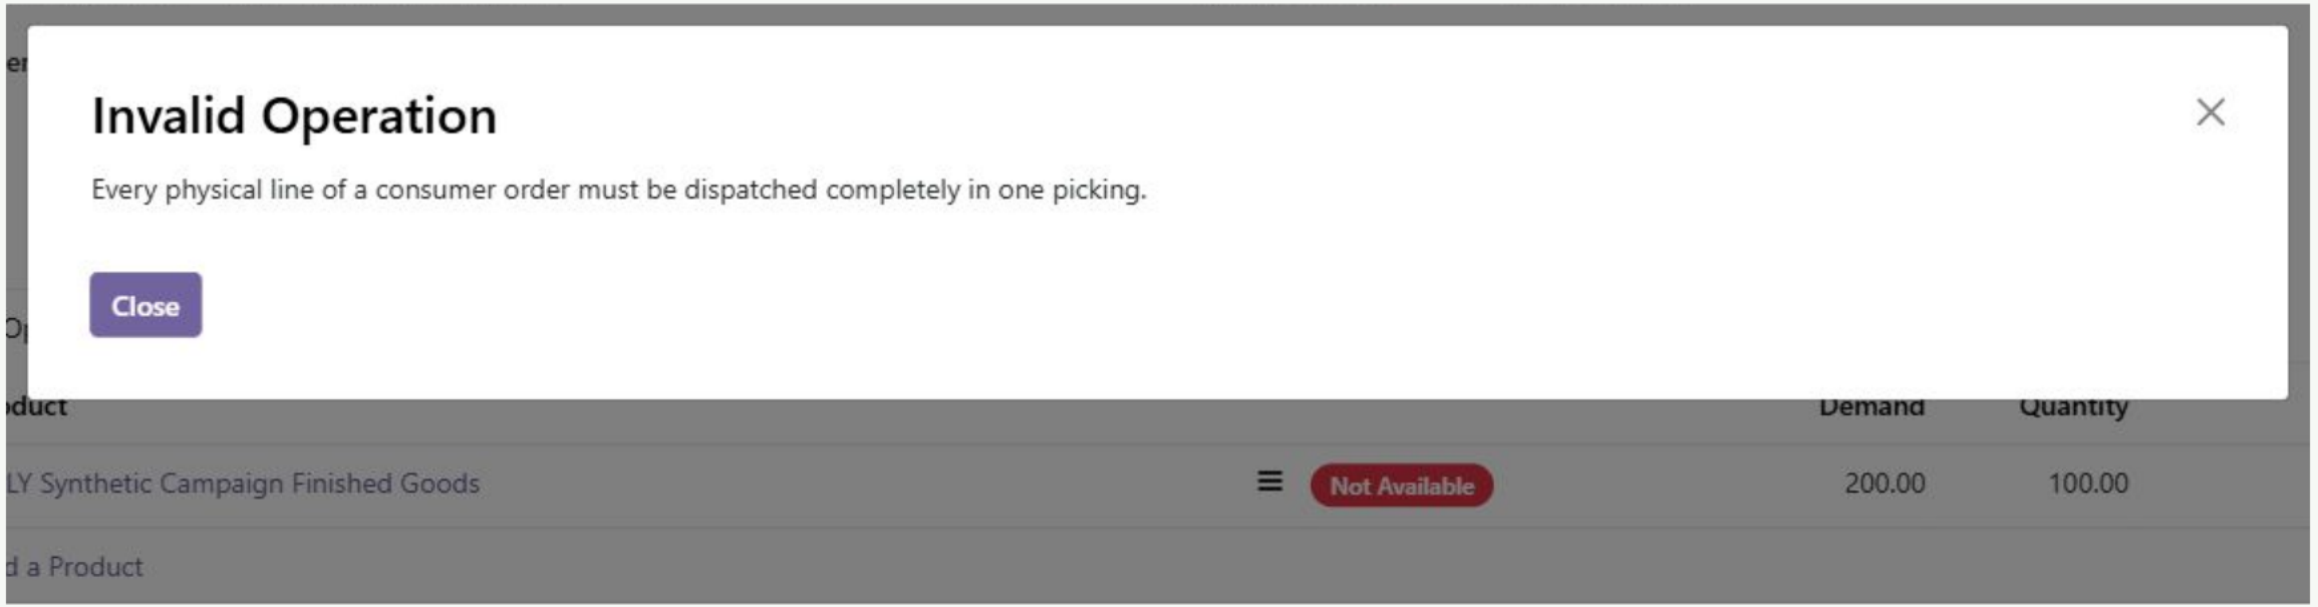

B's accepted 14 December date comes before A's 15 December date.

B now has 500 units reserved. Prepared and non-campaign stock stays protected.

Individual orders ship in full

Example: a user tries to ship 100 of the 200 units ordered.

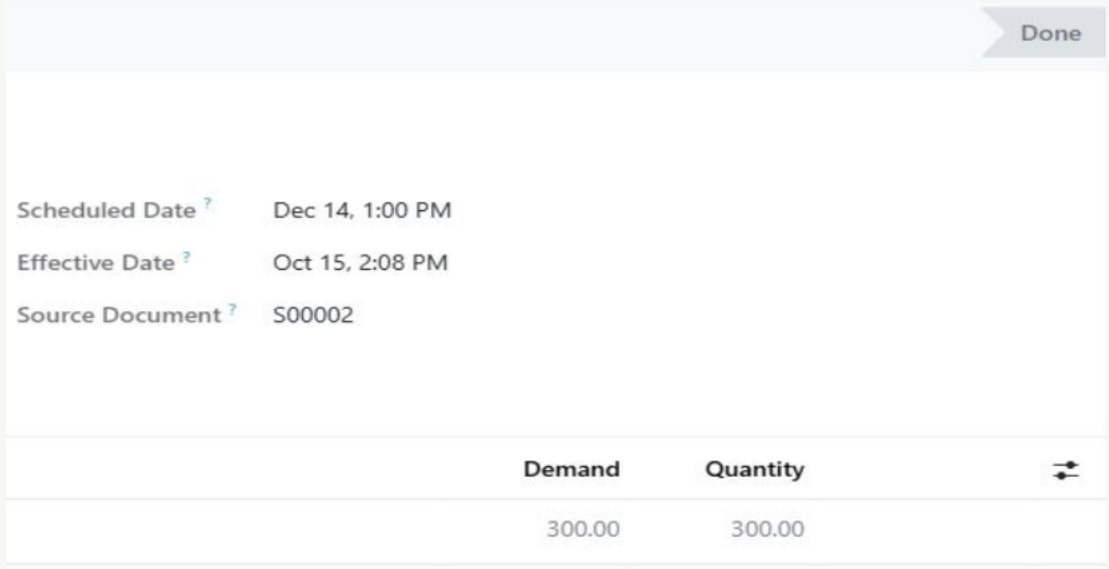

The partial shipment cannot be validated.

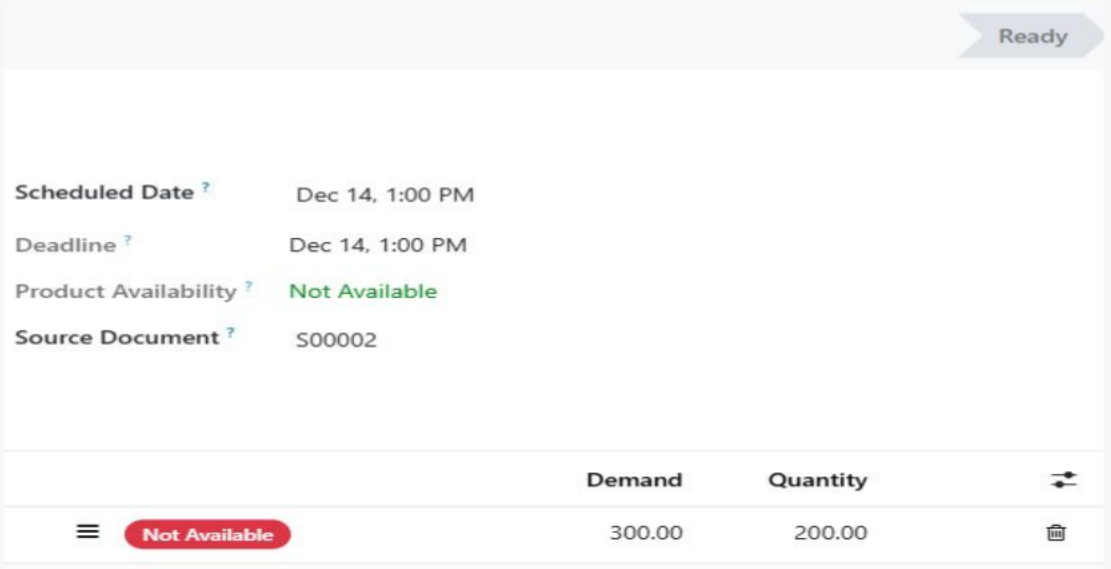

Corporate orders can ship in batches

Browser example: 600 ordered, 300 shipped, 300 remaining.

300 shipped

300 remaining

200 reserved for the next batch

The remaining 300 units stay on a backorder.

HALY produces the missing 400 units

Two suppliers provide raw materials. HALY makes the finished product.

01 **Purchase raw materials**

Buy 400 units of each required input from two suppliers.

02 **Receive the inputs**

Record the materials arriving into stock.

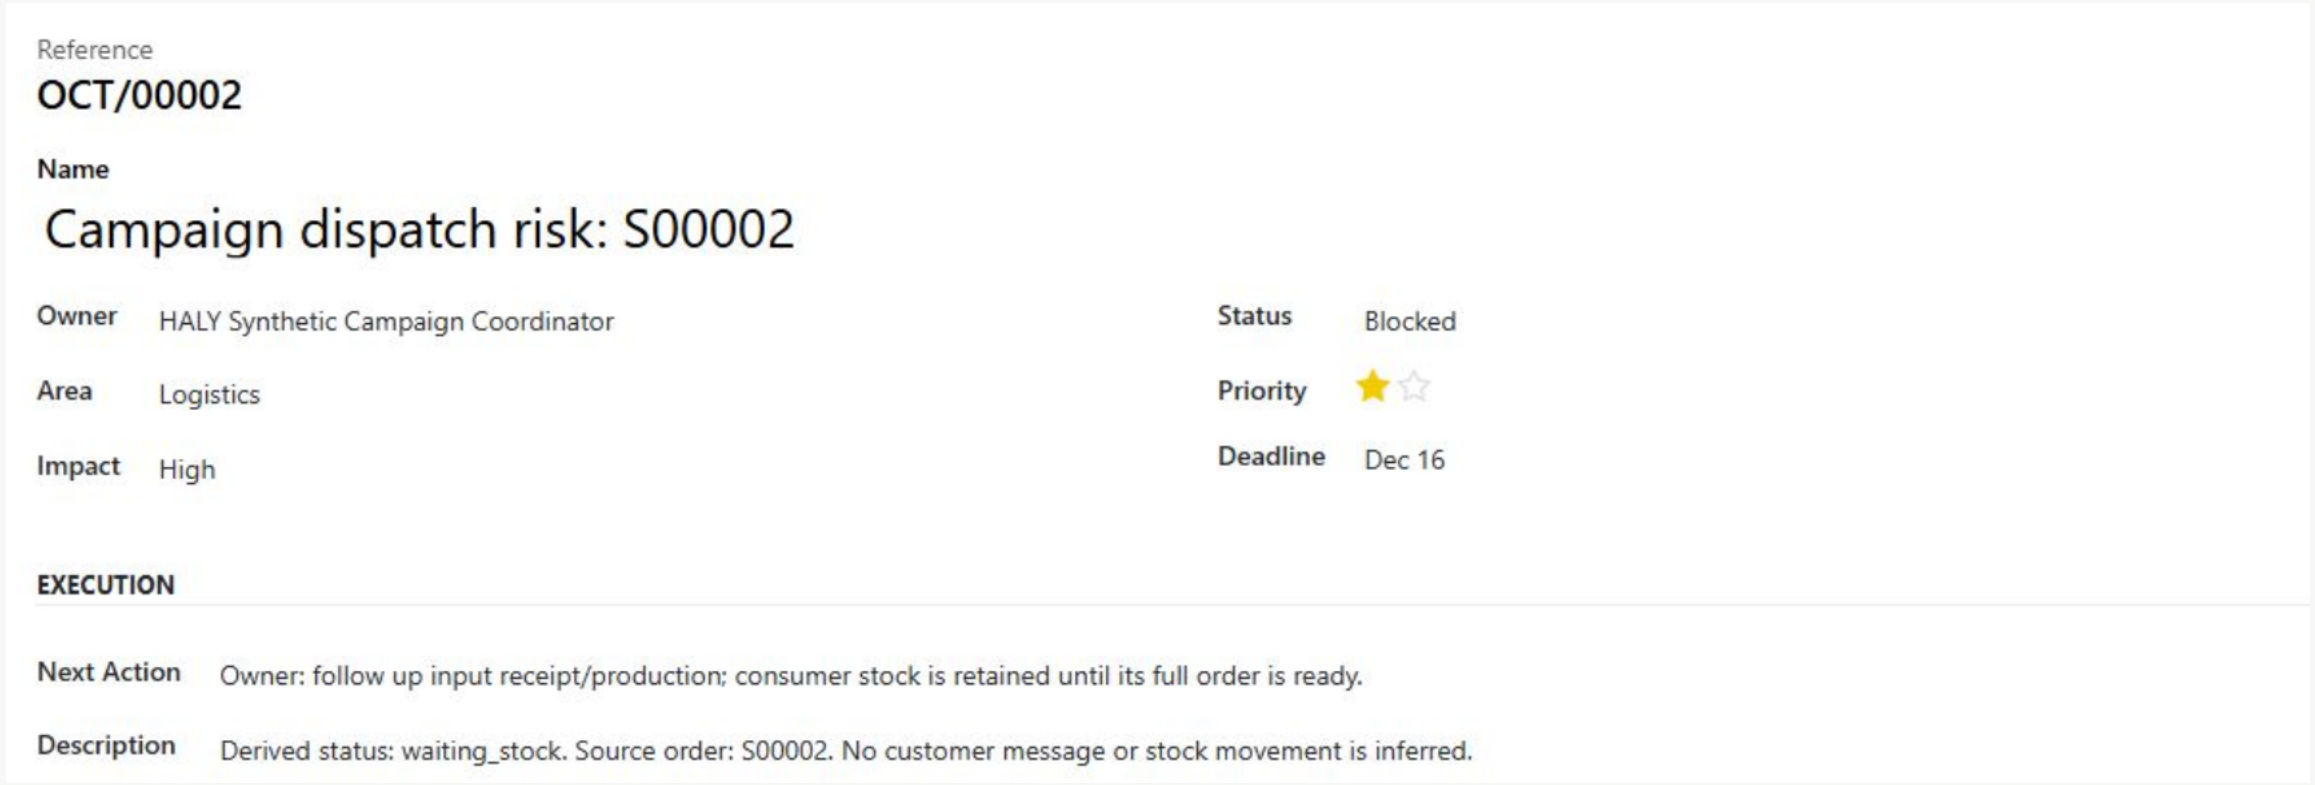

03 **Manufacture 400 finished units**

Complete HALY's own production order.

500 opening + 400 manufactured = 900 units in total

Shortages have an owner

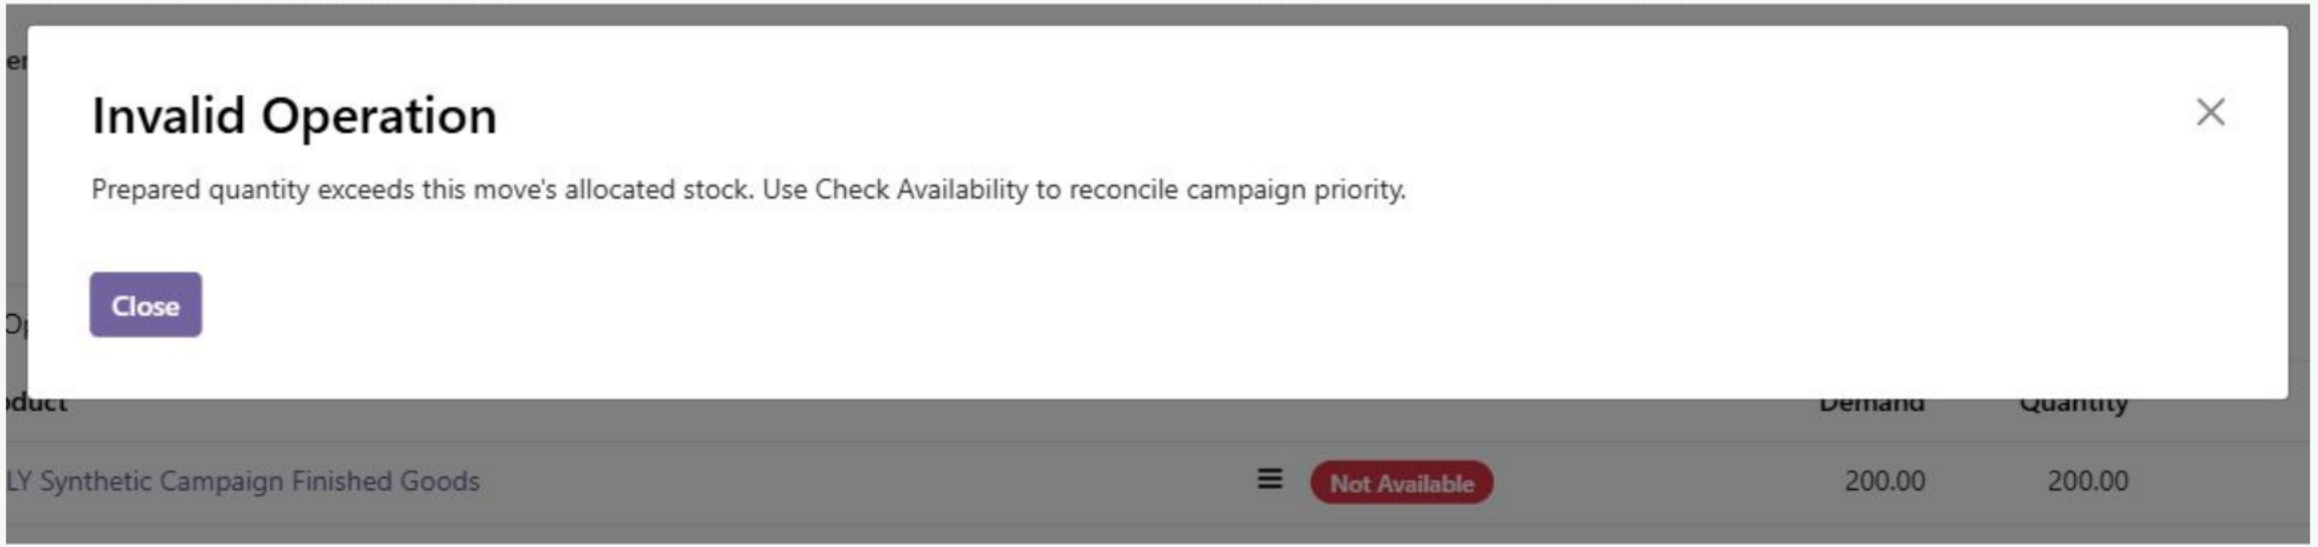

Each risk item links to its sales order and records the next action.

The coordinator can track the order's next action.

Preparation stays within allocated stock

Warehouse users cannot prepare more than the order's allocation.

The system blocks the invalid quantity when the user saves.

All 900 units ship in the full test scenario

Automated local scenario, separate from the browser examples.

Order	Ordered	Shipment pattern	Total shipped
A: individual	200	In full	200
B: corporate	600	300 + 200 + 100	600
C: individual	100	In full	100
Total	900		900

500 opening + 400 manufactured = 900 dispatched

What we built and checked

Standard Odoo operations with campaign-specific business rules.

Standard operations

Sales, purchasing, inventory and own production.

Added controls

Date history, stock priority and shipment safeguards.

Review and testing

Independent review and regression checks.

81

local test methods passed

11

campaign cases passed

Future options: capacity planning and carrier integration.

Technology and source

Platform and tools used in the local demonstration.

Business platform

Odoo 19 Community
Sales, Inventory, Purchase, Manufacturing

Data and environment

PostgreSQL 15
Docker and PowerShell validation helpers

Implementation

Python business rules
XML views and CSV access controls

Version control

Git and GitHub (private)

Repository access required.

Synthetic demo. No production deployment. CI follow-up remains open.
