Operations Control Tower

Seasonal campaign fulfilment
A business portfolio case study

Yusuf Ondes

Fictional company. Synthetic business data.

The campaign creates a 400-unit stock gap

HALY manufactures powdered drinks from raw materials bought from two suppliers.

900
units ordered

500
finished units in stock

400
units to manufacture

The business task: fulfil discounted campaign orders while protecting accepted dispatch commitments.

The operating problem

A stock shortage creates decisions that standard records alone do not resolve.

Which order should receive the next available unit?

Competing commitments

A large corporate order must not automatically outrank an earlier promise.

Changing promises

A proposal must not silently become a new commitment or hide the original date.

The fulfilment workflow

Standard purchasing and manufacturing support focused campaign controls.

01 **Confirm the order and dispatch promise**

Sales records the shipment policy and accepted warehouse date.

02 **Allocate the available stock**

Earlier accepted commitments receive eligible stock first.

03 **Purchase inputs and manufacture the shortage**

Staff record receipts and production through standard Odoo operations.

04 **Ship within the customer policy**

Individuals receive complete orders. Corporate customers can receive batches.

05 **Act on exceptions**

A linked risk item shows the responsible owner and the next action.

Promise dates set stock priority

Three confirmed orders compete for 500 available finished units.

Order	Shipment policy	Ordered	Dispatch date	Allocated
A	Individual: complete	200	15 Dec 2026	200
B	Corporate: batches	600	16 Dec 2026	300
C	Individual: complete	100	17 Dec 2026	0
Total		900		500

Dispatch dates determine priority for both customer types.

One order keeps its promise history

Original commitment: 16 December. Recorded accepted commitment: 14 December.

Order	S00002
Original Date	Dec 16
Current Date	Dec 14
Estimate Date	
Responsible	HALY Synthetic Campaign Coordinator
Revision	2
Established By	HALY Synthetic Campaign Coordinator
Established At	Oct 15, 2:02 PM

Proposed D...	State	Is Stale	Response Decision	Response At	Response User
Dec 14	Accepted	☐	Accepted	Oct 15, 2:07 PM	HALY Synthetic Campaign Coordinator

Customer responses control date changes

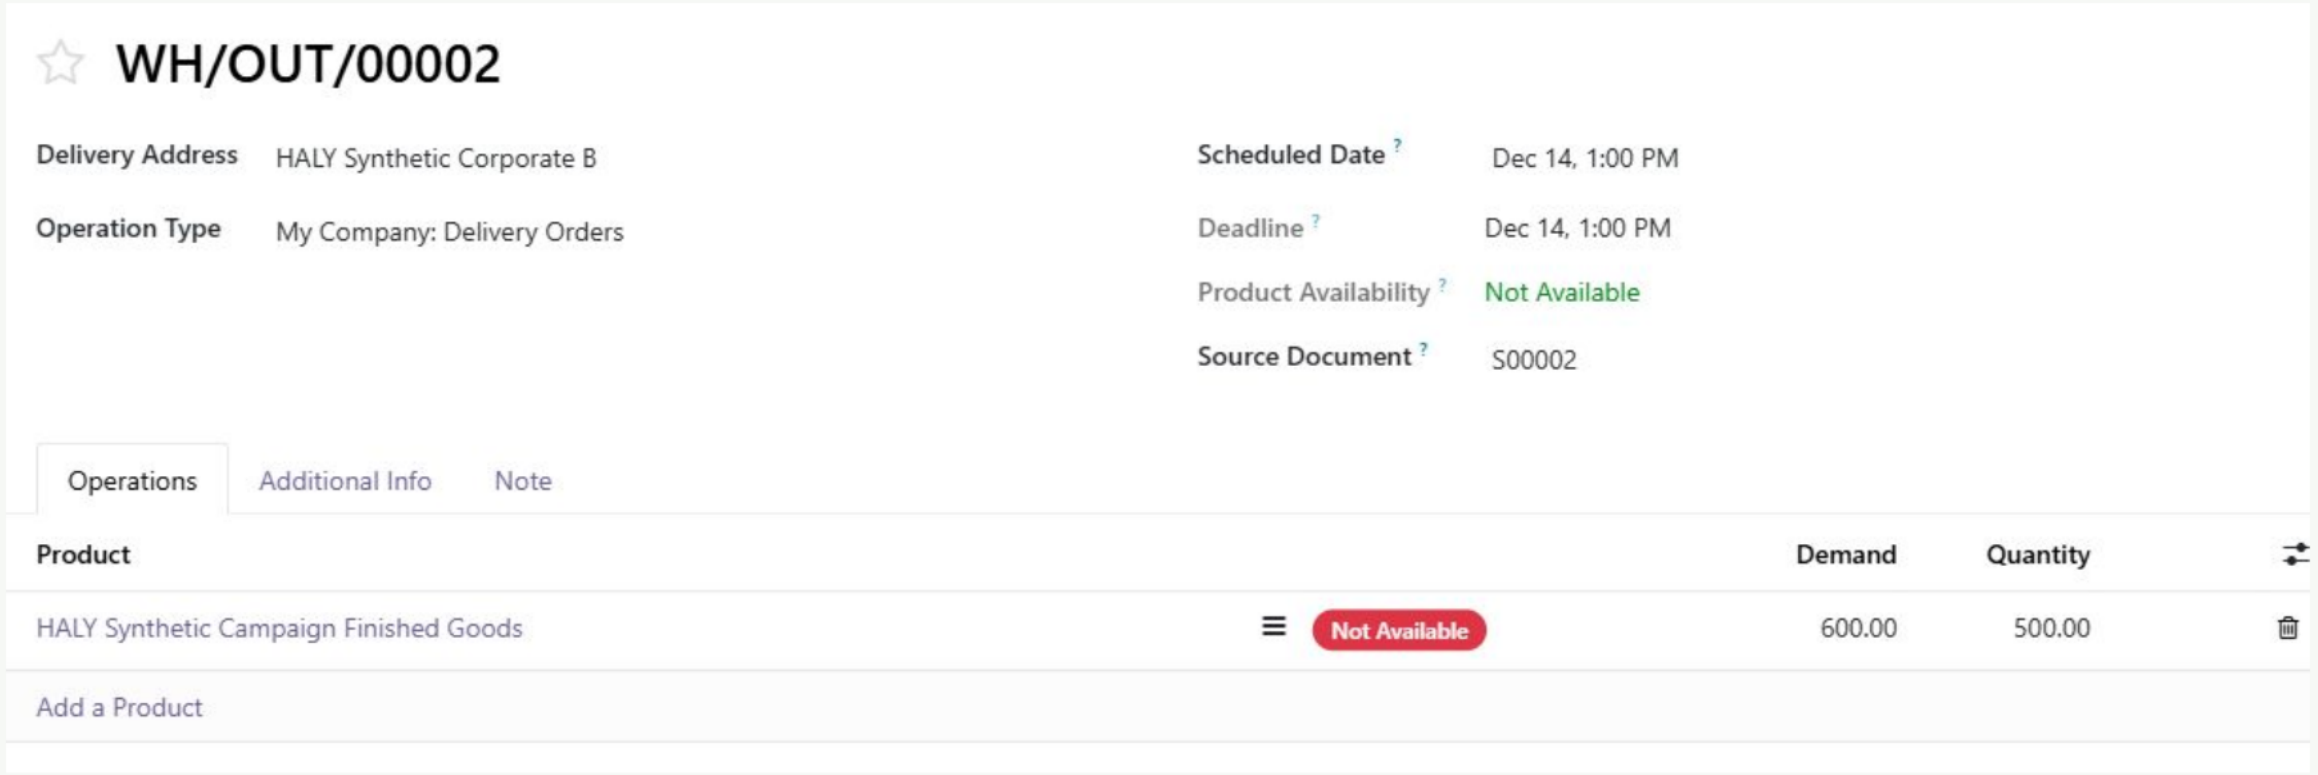

Staff record the customer response before a new date controls priority.

Recorded response	Active commitment	Stock-priority effect
Pending	Existing accepted date	No change
Rejected	Existing accepted date	No change
Accepted and current	New accepted date	Recalculate eligible stock

Unanswered or rejected proposals keep the existing commitment and its risk visible.

An earlier accepted date can change allocation

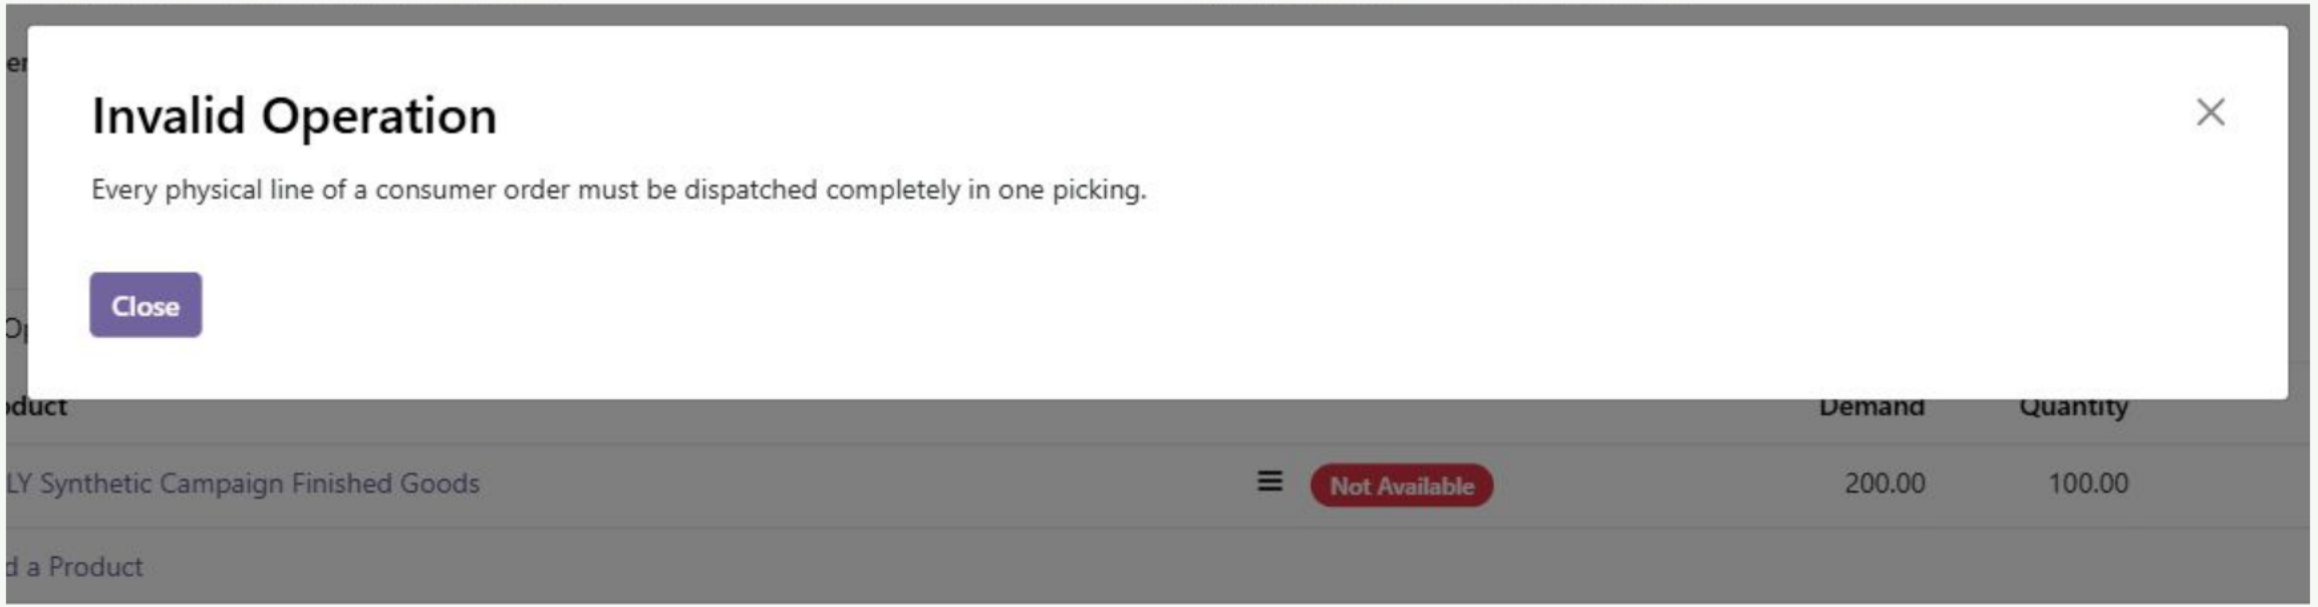

Browser example: B moves to 14 December, before A. It then receives 500 units.

Prepared stock and outside reservations remain protected.

Individual orders require a complete shipment

Attempt: dispatch 100 units against an individual order for 200.

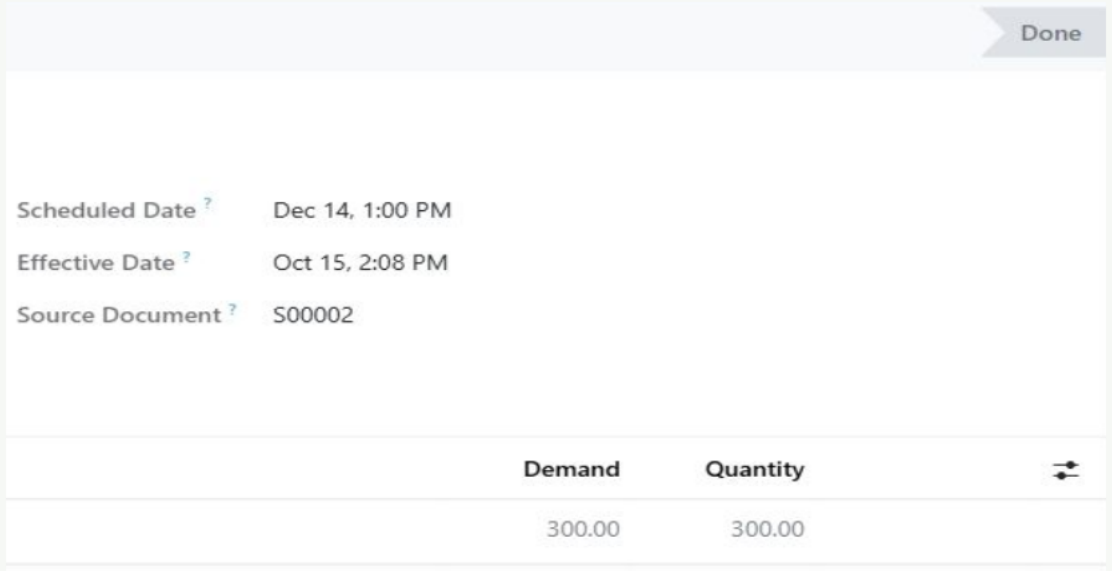

The system refuses the incomplete shipment before physical completion.

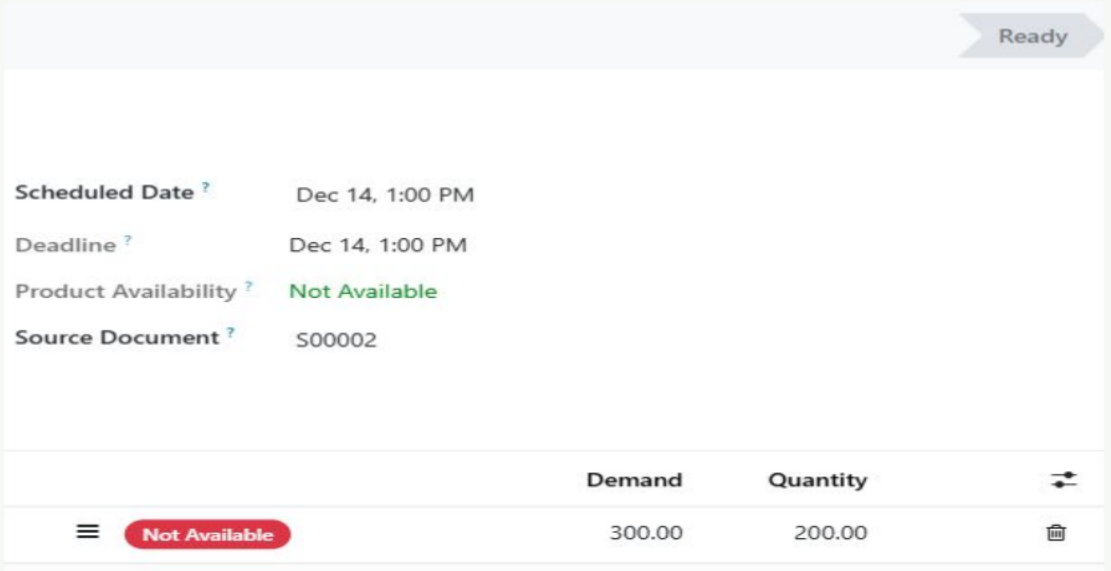

Corporate shipments retain the open balance

Browser example: 600 ordered, 300 dispatched, 300 left to fulfil.

300 dispatched

300 still outstanding

200 reserved for the next batch

A backorder keeps the remaining demand visible for the next shipment.

HALY manufactures the missing 400 units

The end-to-end scenario uses two raw-material suppliers.

01 **Two raw-material suppliers**

The scenario creates two 400-unit input purchase orders.

02 **Record the incoming materials**

Standard receipts make the inputs available for production.

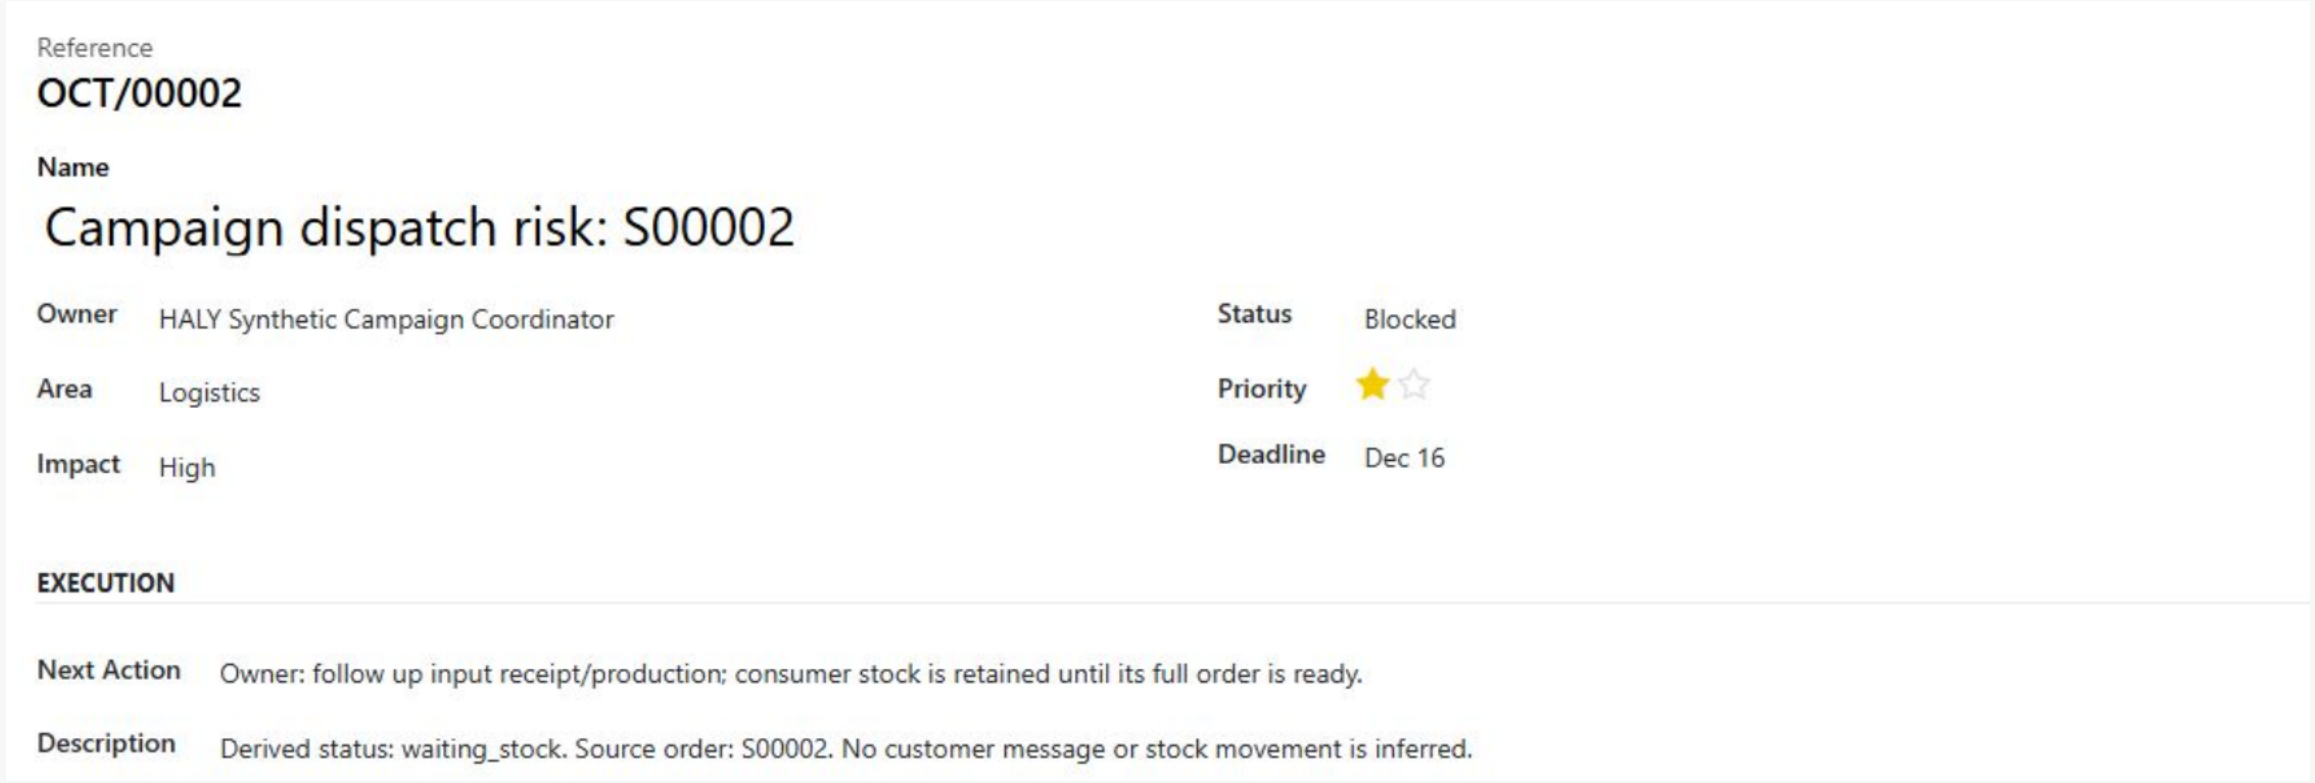

03 **Complete HALY production**

A manufacturing order produces 400 finished units.

500 opening stock + 400 manufactured = 900 units available

Every shortage has an owner and a next action

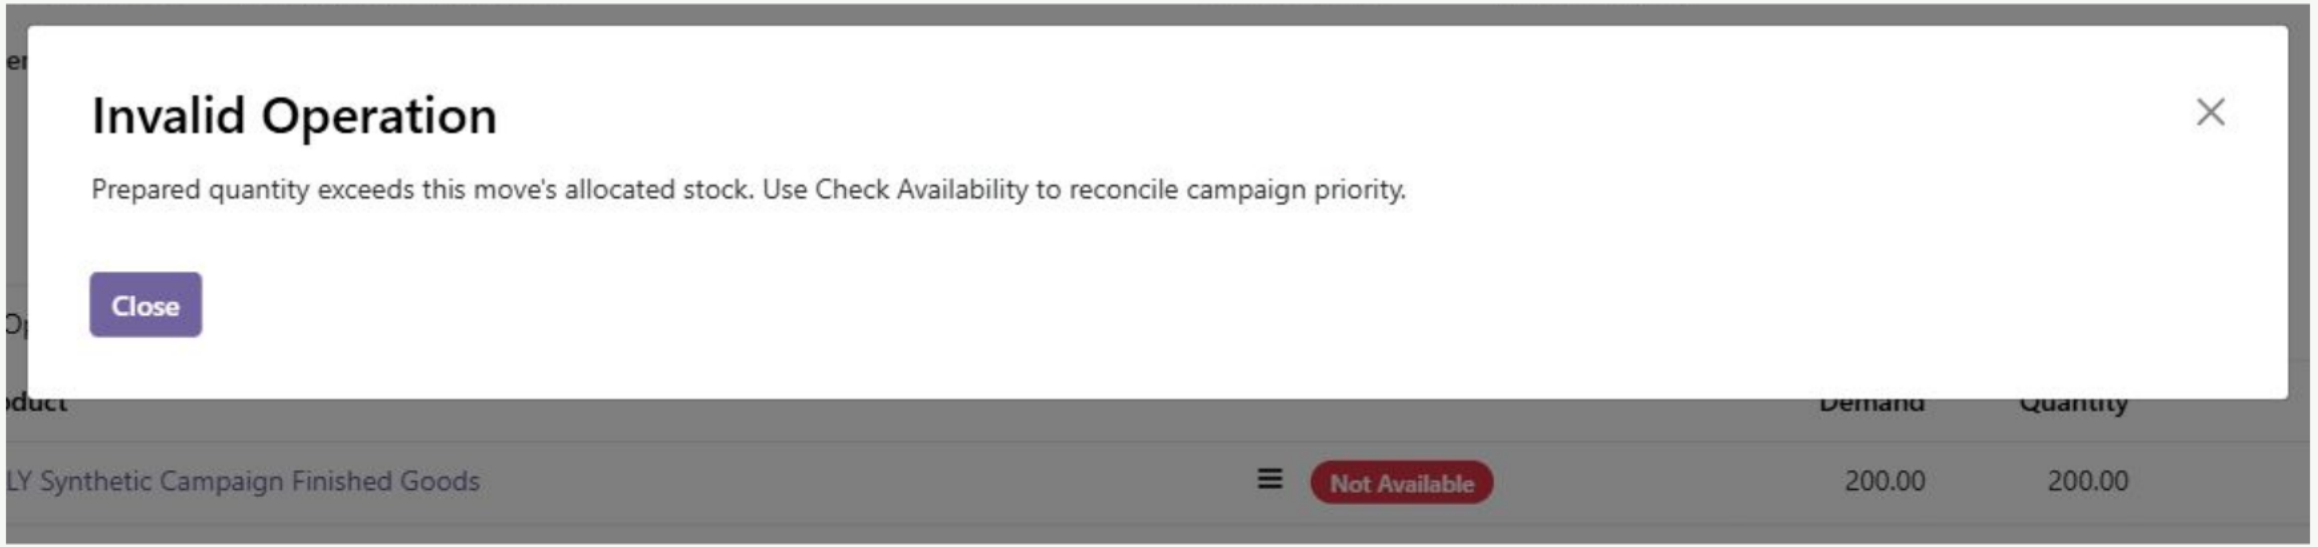

A source-linked risk item connects the sales commitment with operational follow-up.

The team can see who must act and which order needs attention.

Manual preparation respects stock priority

Warehouse users cannot claim more campaign stock than the order receives.

An invalid quantity stops at Save, before it can become a completed shipment.

The full scenario fulfils all 900 units

Validated end-to-end scenario, separate from the browser examples.

Order	Ordered	Dispatch pattern	Total shipped
A: individual	200	One complete shipment	200
B: corporate	600	300 + 200 + 100	600
C: individual	100	One complete shipment	100
Total	900		900

500 opening + 400 manufactured = 900 dispatched

Project work and validation

Business decisions became explicit rules with evidence behind the results.

Standard ERP foundation

Sales, inventory, purchasing and own manufacture.

Focused extensions

Promise history, date-first allocation, shipment guards and owned exceptions.

Reviewed delivery

Independent review, repairs, regression checks and owner acceptance.

81

local test methods

11

campaign cases

Business capability and next opportunities

Capabilities demonstrated in a controlled synthetic scenario.

Business need	Capability demonstrated
Consistent stock decisions	Accepted-date priority with protected reservations
Clear customer commitments	Original/current dates and recorded response history
Controlled fulfilment	Complete individual orders and corporate backorders
Accountable follow-up	One source-linked risk item with owner and next action

Possible next phase

Capacity planning, carrier integration and a separately validated production rollout.

Technology and delivery

Standard Odoo with focused extensions and a reproducible synthetic demonstration.

Business platform

Odoo 19 Community
Sales, Inventory, Purchase, Manufacturing

Data and environment

PostgreSQL 15
Docker and PowerShell validation helpers

Implementation

Python business rules
XML views and CSV access controls

Version control

Git and Private GitHub repository

Portfolio scope: synthetic data, no production deployment. CI startup-health follow-up remains open.
