Seasonal orders at HALY

Operations Control Tower

HALY makes powdered drink mixes
and packs them in cans.

An Odoo portfolio case

Fictional company and synthetic business data

The stock shortage

HALY is a powdered-drink manufacturer.
A seasonal promotion creates more orders
than the available finished stock can cover.

900 units ordered

500 units in stock

400 units to make

Two suppliers provide the raw materials.
HALY uses them to make the remaining units.

The question is who gets the available stock while production catches up.

How the work flows

1. Sales	Record the accepted warehouse dispatch date.
2. Stock	Reserve eligible stock in accepted-date order.
3. Supply	Receive raw materials and record in-house production.
4. Warehouse	Prepare and validate the permitted shipments.
5. Follow-up	Give shortages an owner and a next action.

Standard Odoo records the purchases, production and shipments.

The custom addons add date history, stock priority and dispatch checks.

First stock allocation

The first 500 units go to the orders with the earliest accepted dispatch dates.

Order	Shipment policy	Units ordered	Accepted dispatch date	Units reserved
A	Individual: full order	200	15 Dec 2026	200
B	Corporate: batches	600	16 Dec 2026	300
C	Individual: full order	100	17 Dec 2026	0
Total		**900**		**500**

Customer type changes the shipment policy, not the stock priority.

Changing a dispatch date

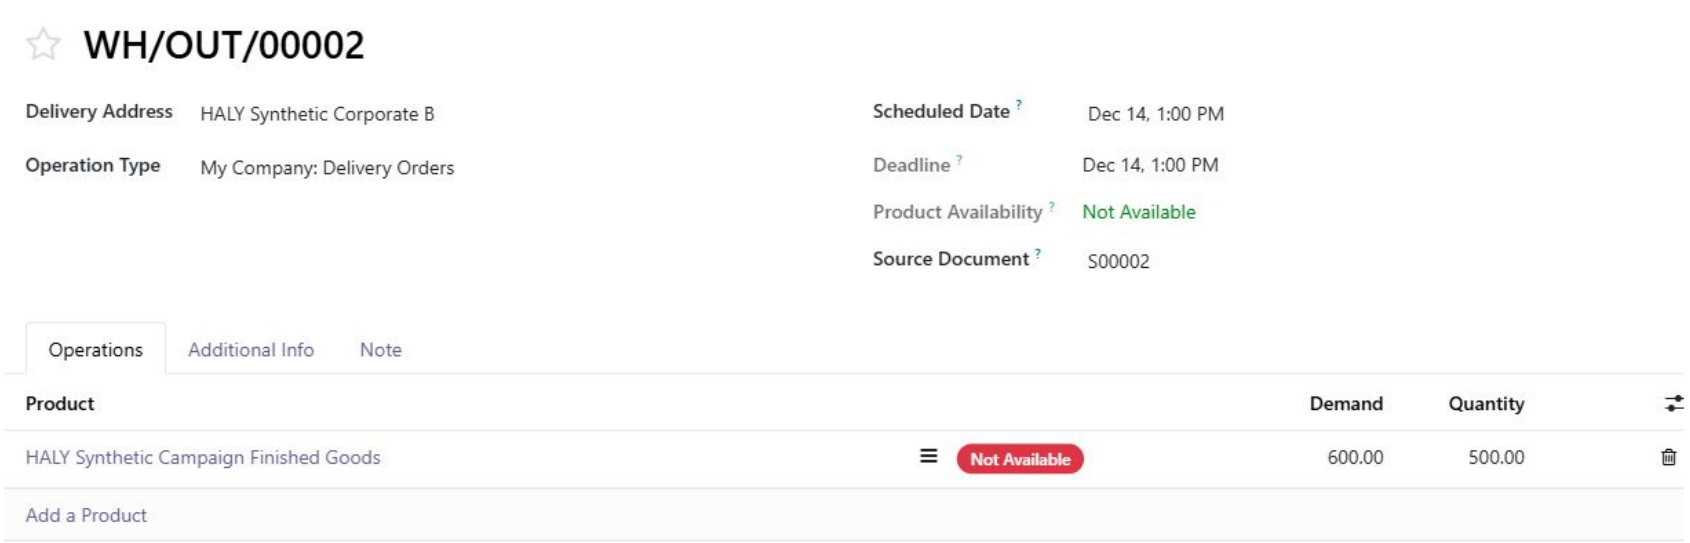

A coordinator records acceptance of a proposal to move B from 16 to 14 December.
The original date stays in the history. Pending or rejected proposals keep the current date.

Order	S00002
Original Date	Dec 16
Current Date	Dec 14
Estimate Date	
Responsible	HALY Synthetic Campaign Coordinator
Revision	2
Established By	HALY Synthetic Campaign Coordinator
Established At	Oct 15, 2:02 PM

Proposed D...	State	Is Stale	Response Decision	Response At	Response User	Promise Date...
Dec 14	Accepted	☐	Accepted	Oct 15, 2:07 PM	HALY Synthetic Campaign Coordinator	☑

Staff enter the response manually. The system does not contact the customer.

Stock after the date change

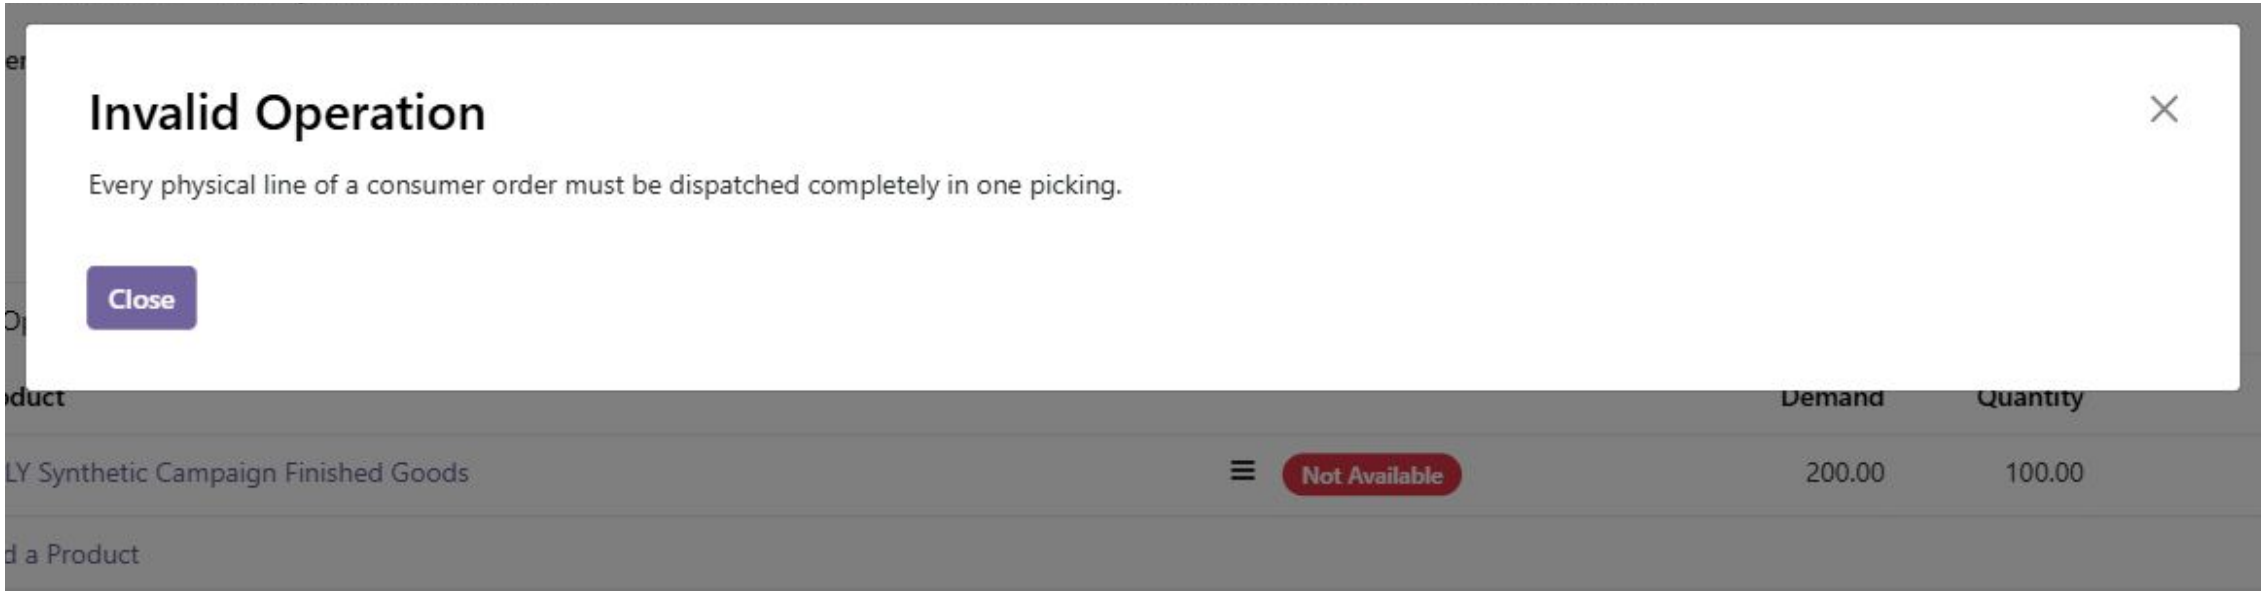

B now has the earliest accepted dispatch date.

600 units ordered
500 units reserved

The 500 eligible units move to B because they have not entered preparation.
Stock already in preparation and reservations outside the campaign stay protected.

Individual orders

Separate check: an individual order for 200 units cannot ship only 100.
It keeps its allocated stock while it waits for the full quantity.

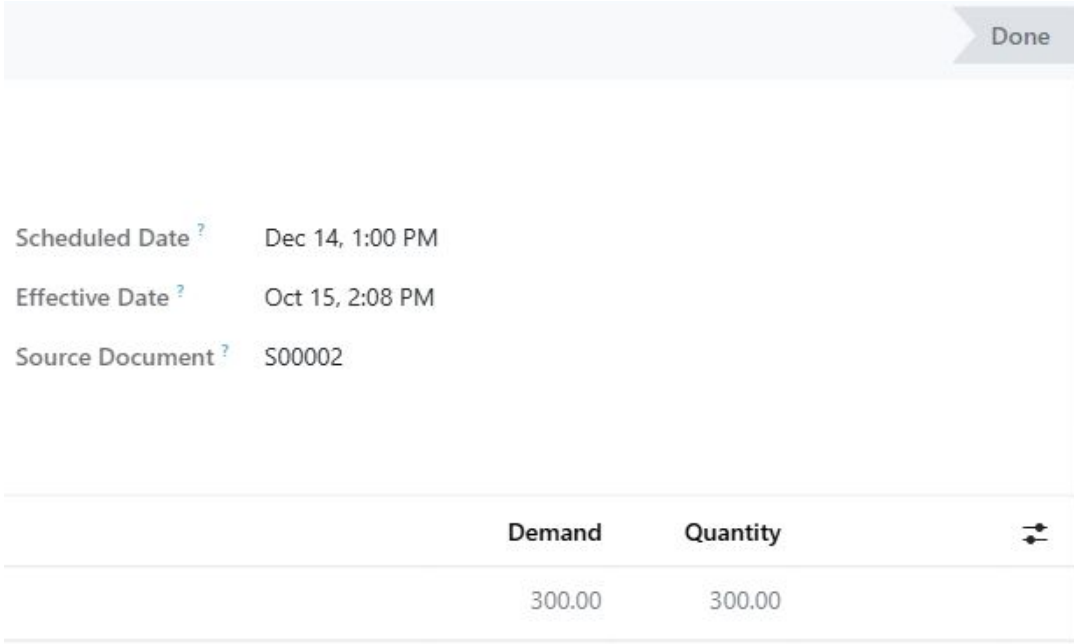

The partial shipment is refused before dispatch.

Corporate shipments

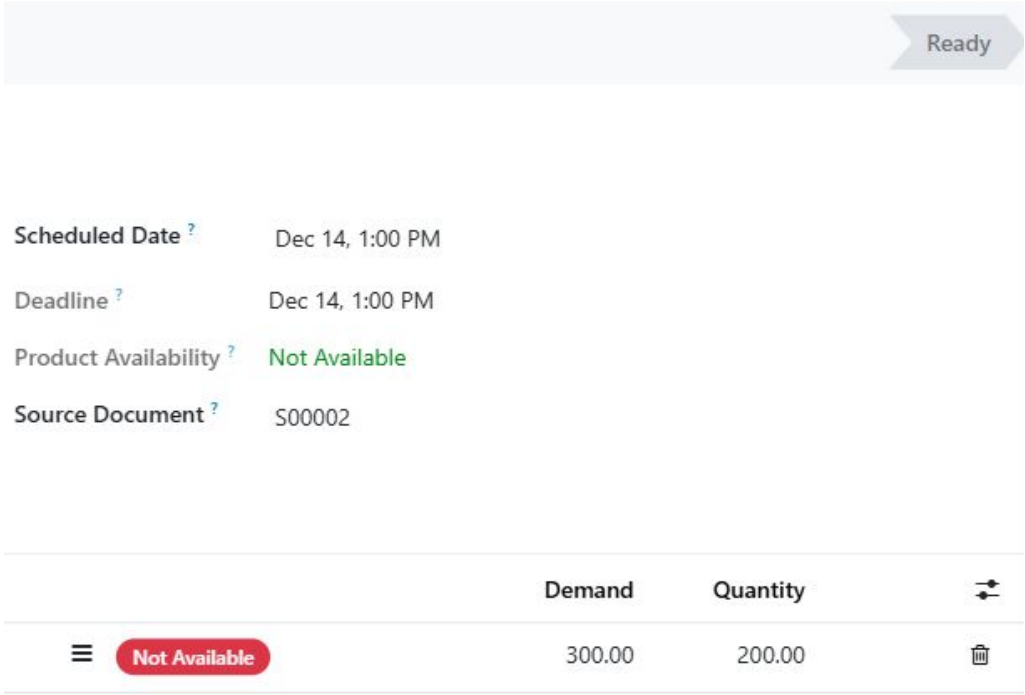

Corporate orders can leave in batches. Here, 300 of the 600 units have shipped, and the other 300 remain on a backorder.

First shipment: 300 units

Browser example, separate from the full test scenario on slide 12.

Backorder: 300 outstanding

200 units reserved for the next batch

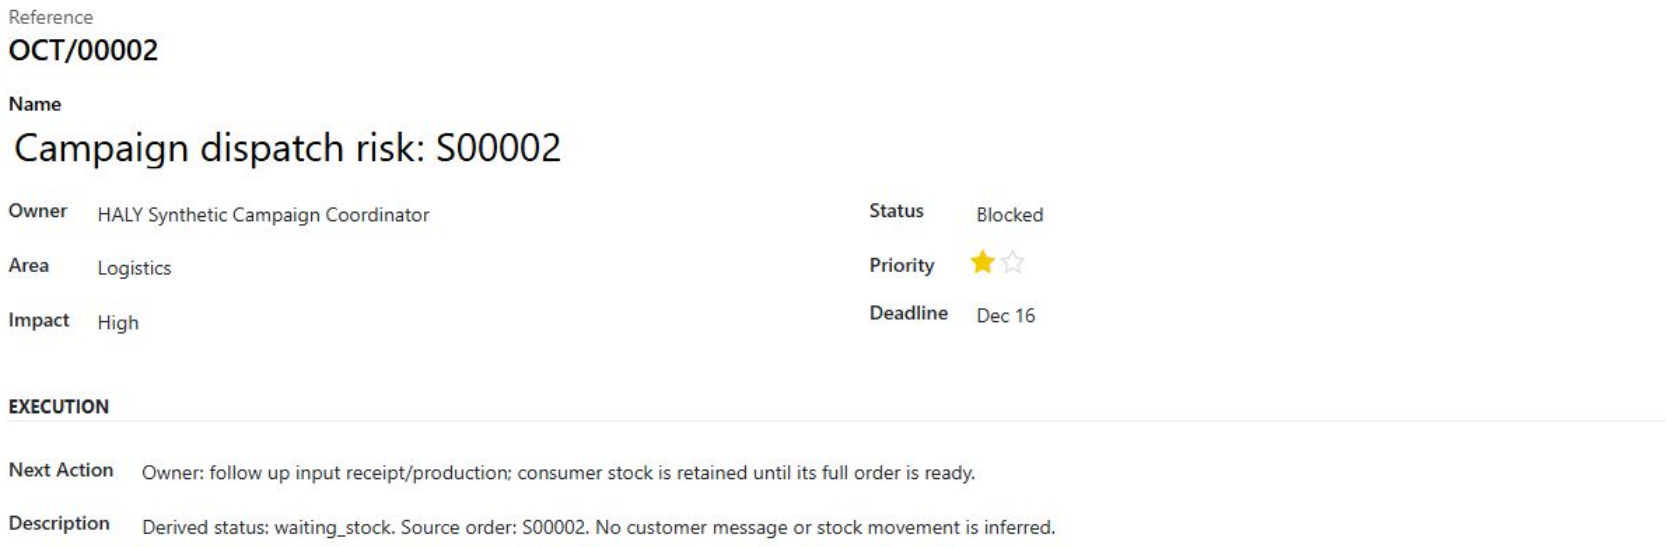

Making the remaining stock

The full test scenario covers purchasing and production, as well as dispatch.

1. Buy the inputs	400 units of each required raw material, from two suppliers.
2. Record receipt	Add the received inputs to stock.
3. Make the product	Complete a production order for 400 finished units.

500 opening units + 400 manufactured = 900 finished units

Following up on a shortage

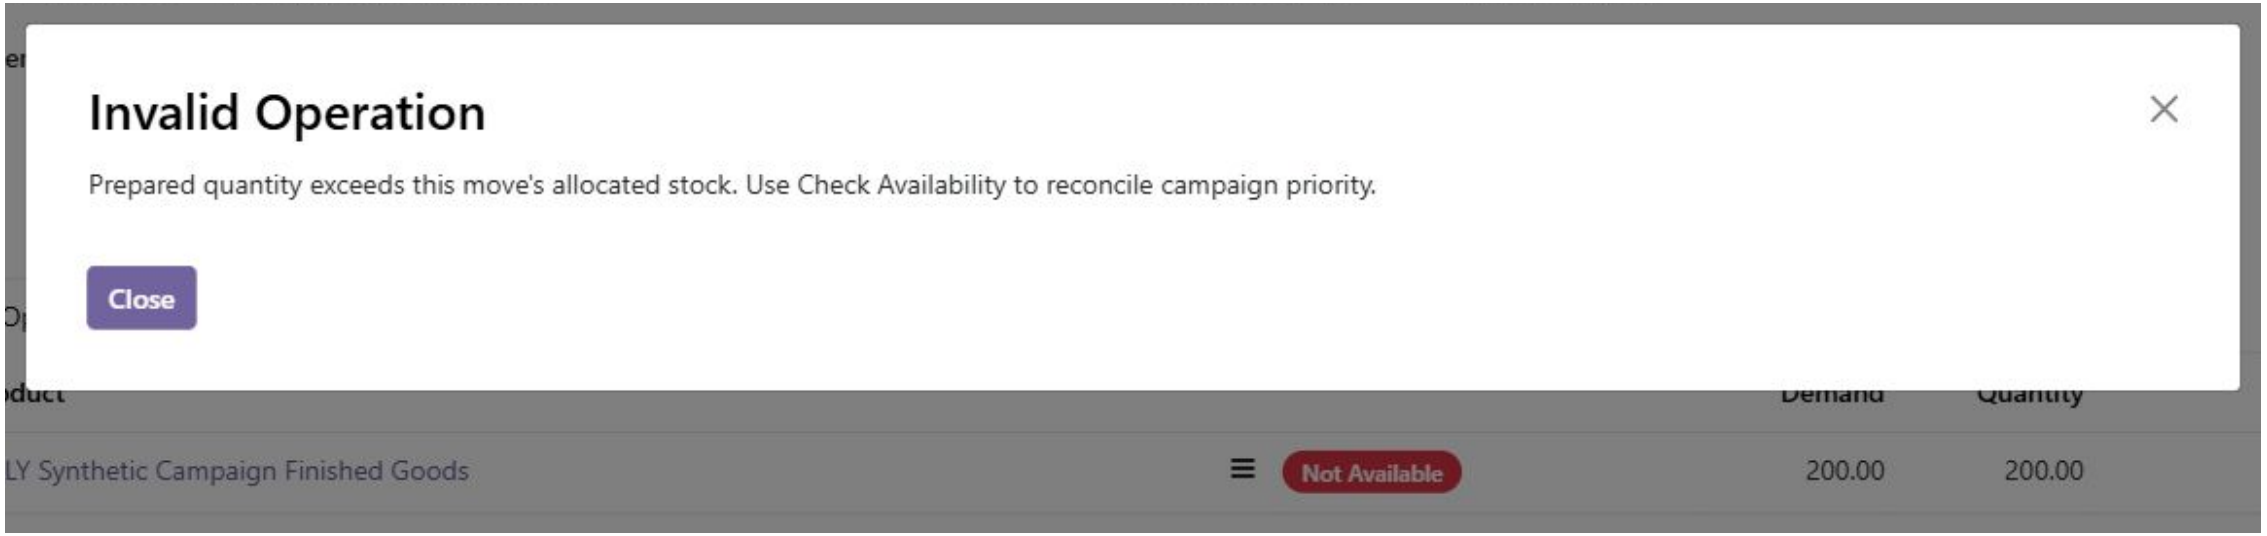

Follow-up

The coordinator can see who owns the issue and what to do next.

Each shortage links back to its sales order. The record stays visible while the issue is open.

Checking preparation quantities

Separate check: a warehouse user tries to prepare more than the order's allocated stock. The system refuses the quantity when it is saved.

The operator must reconcile availability before preparing more stock.

The completed test scenario

Local synthetic end-to-end test, separate from the browser examples.

Order	Units ordered	Shipments	Units dispatched
A: individual	200	One full shipment	200
B: corporate	600	300 + 200 + 100	600
C: individual	100	One full shipment	100
Total	**900**		**900**

The test combines 500 opening units with 400 manufactured units.
All 900 ordered units are dispatched.

My work on the case

Business decisions

I defined the scenario and approved the rules for dispatch dates, reservations and partial shipments.

Checks and results

81 local test methods passed.
11 campaign checks also passed.
Recorded on 15 October 2026.

Review and revision

Review exposed ways to prepare stock outside the allocation. Those cases shaped the final controls and regression checks.

Outside the current scope

Capacity planning, carrier/WMS integration and production hosting would need separate work.

These checks demonstrate functional behaviour, not measured savings or delivery-rate improvements.
